To Whom It May Concern,

Subject: Confirmation of the Structural Lifespan of Buildings Constructed with the EMMEDUE Building System

This letter is issued by EMMEDUE Company to confirm the proven durability and expected structural lifespan of buildings constructed using the EMMEDUE Building System.

The EMMEDUE Building System, based on advanced structural panels composed of expanded polystyrene and galvanized steel wire mesh, has been in continuous use worldwide since 1981.

Numerous buildings constructed with this system over the past four decades remain in excellent structural and aesthetic condition today, demonstrating its reliability, long-term performance, and resistance to environmental and seismic stresses.

Based on technical data, field experience, and long-term performance of existing structures, the expected structural lifespan of buildings constructed with the EMMEDUE System is over 50 years, provided that they are designed, constructed, and maintained in accordance with the applicable standards and the system's technical specifications.

This statement is made in good faith to provide assurance of the structural integrity and durability of the EMMEDUE Building System.

Sincerely,

Valeria Candiracci

CEO
